REASONS FOR ALLOWANCE

1. Claims 2-20 are allowed.

The following is a statement of reasons for the indication of allowable subject matter:

- With regard to claims 2-4, 19, and 20 as the closest reference of record, Otsubo et al (US 6,041,033) discloses a chucking apparatus in Figs. 1-7 in which a plurality of pawl bodies 126 are provided in a radial direction of a hub body 125 of a turntable such that the pawl bodies can move, and a center hole of a disk 23 is pressed by the pawl bodies to hold the disk (Fig. 7), wherein the chucking apparatus comprises a resilient member 127 for biasing the pawl bodies outward of the hub body, each of the pawl bodies includes a pawl portion 126d which comes into contact with the disk, and a pawl-side stopper 126a for limiting outward movement of the pawl bodies caused by the resilient member (Column 6, lines 31-34), the hub body includes a pawl opening 125a (Fig. 5C) through which the pawl portion can project outward, and a hub-side stopper 125b (Figs. 5A and 6) which abuts against the pawl-side stopper, a downward guide surface 126b is provided at a location lower than a tip end of the pawl portion, the hub body is provided with an upper receiving surface 122 at a position opposed to the downward guide surface, and the pawl portion is pressed from above so that the downward guide surface slides along the upper receiving surface and the pawl portion moves inward (Figs. 6 and 7); **but fails to show** a surface extending downward from the tip end of the pawl portion is a disk holding surface, and the downward guide surface is provided on a side portion of the disk holding surface.
- With regard to claims 5 and 7, Otsubo et al **fails to show** that the downward guide surface comprises at least a first inclined surface and a second inclined surface, if the pawl portion is pressed from above by the disk, the first inclined surface is a surface against which the upper receiving surface abuts when a tip end of the pawl portion is inserted into a center hole of the disk or before the tip end of the pawl portion is inserted into the center hole of the disk, the second

inclined surface is a surface against which the upper receiving surface abuts after the tip end of the pawl portion is inserted into the center hole of the disk, an angle formed between the second inclined surface and a pressing direction is smaller than an angle formed between the first inclined surface and the pressing direction.

- With regard to claim 6, Otsubo et al **fails to show** that an inner side guide surface comprising an inclined surface which gradually becomes higher toward a center of the hub body is provided on an inner side of the pawl body, the inner side guide surface comprises at least a first inclined surface and a second inclined surface, if the pawl portion is pressed from above by the disk, the first inclined surface is a surface against which the pawl-side stopper abuts when a tip end of the pawl portion is inserted into a center hole of the disk or before the tip end is inserted into the center hole of the disk, the second inclined surface is a surface against which the pawl-side stopper abuts after the tip end of the pawl portion is inserted into the center hole of the disk, an angle formed between the second inclined surface and a pressing direction is smaller than an angle formed between the first inclined surface and the pressing direction.
- With regard to claim 8, Otsubo et al **fails to show** that the upper receiving surface comprises at least a first inclined surface and a second inclined surface, if the pawl portion is pressed from above by the disk, the first inclined surface is a surface against which the downward guide surface abuts when a tip end of the pawl portion is inserted into a center hole of the disk or before the tip end is inserted into the center hole of the disk, the second inclined surface is a surface against which the downward guide surface abuts after the tip end of the pawl portion is inserted into the center hole of the disk, an angle formed between the second inclined surface and a pressing direction is smaller than an angle formed between the first inclined surface and the pressing direction.

- With regard to claims 9-18, Otsubo et al **fails to show** that a surface extending downward from a tip end of the pawl portion is a disk holding surface, and the downward guide surface is provided on a side portion of the disk holding surface, the pawl body is provided with the downward guide surface at a location higher than the disk holding surface or at a location of the same height as that of the disk holding surface, a downward receiving surface is provided on the hub body at a location opposed to the upward guide surface, the pawl opening is provided in a range extending from an outer periphery of an upper surface of the hub body to its side surface, a side surface opening width of the side surface is greater than an upper surface opening width of the outer periphery of the upper surface of the pawl opening, the downward receiving surface is disposed on lower surfaces of both side portions of the upper surface opening, and the upper receiving surface is disposed on upper surfaces of both side portions of the side surface opening.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
